Immunization Coding

for Obstetrician–Gynecologists 2013
All diagnosis codes referred to in Immunization Coding for Obstetrician–Gynecologists were excerpted from the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM), October 2012 Revision, published by the United States Government under the auspices of the ICD-9-CM Coordination and Maintenance Committee.

Introduction

Immunizations are recommended as part of comprehensive care for women. Therefore, the American College of Obstetricians and Gynecologists (the College) and its Immunization Expert Work Group recognized a need for a coding guide solely focused on immunization. Correct coding helps ensure that a practice receives payment for the vaccines given to patients. Proper coding means being sure that the code selected is appropriate as follows:

• The code represents the most accurate description of “what” was performed and “why” it was performed consistent with coding conventions and guidelines

• The code is supported by documentation in the medical record

The Current Procedural Terminology (CPT) coding guidelines state that the code selected must be the most accurate description of the service provided and be consistent with coding conventions and guidelines. Individuals responsible for coding should carefully review their coding books, including any coding guidelines, notes, instructions, or other explanatory statements. These may be printed under subsections, headings, subheadings, or before and after codes. The physician also should know the bundling and unbundling rules used by CPT, commercial payers, and the Centers for Medicare & Medicaid Services.
Reimbursement for Vaccinations

In order to ensure that a practice will receive adequate payment for vaccines provided within the office-based setting, a clinical practice must investigate whether their third-party payers cover these services, and if so, whether that payment is allowed for vaccine drugs and administration.

Medicare

Medicare Part B currently covers preventive vaccine costs for three conditions:

1. Influenza (once per influenza season). Use CPT codes 90654, 90656, 90658, 90660, or 90662 or Q codes Q2034, Q2035, Q2036, Q2037, Q2038, or Q2039. They may be linked to diagnosis code V04.81. Payment is 100% of the Medicare allowable reimbursement.

2. Pneumococcal polysaccharide (once per lifetime). Use CPT codes 90669 or 90732 linked to diagnosis code V03.82. Payment is 100% of the Medicare allowable reimbursement.

3. Hepatitis B (for those in medium-risk to high-risk categories). Use CPT codes 90739–90747 linked to diagnosis code V05.3. The Part B deductible and coinsurance are waived.

Medicare typically pays for only one flu vaccination per year. If more than one vaccination is medically necessary (eg, multiple doses are required), then Medicare will pay for those additional vaccinations. If a patient receives both the influenza shot and a pneumococcal pneumonia virus vaccine during the same visit, use diagnosis code V06.6.

The pneumococcal vaccine is paid once per patient in most cases. However, Medicare will reimburse for revaccination if the patient is considered to be at the highest level of risk of a serious pneumococcal infection and for patients likely to have a rapid decrease in pneumococcal antibody levels. At least 5 years must have passed since the most recent dose of this vaccine.

Hepatitis B vaccinations are reimbursed only for Medicare beneficiaries considered to be at highest risk and those most likely to have rapid decreases in antibody levels. Medicare defines highest risk as patients with functional or anatomic asplenia, human immunodeficiency virus (HIV) infection, leukemia, lymphoma, Hodgkin disease, multiple myeloma, generalized malignancy, chronic renal failure, nephrotic syndrome, or other conditions associated with immunosuppression.

Medicare Part B does not cover other immunizations unless they are directly related to the treatment of an injury or direct exposure to a disease or condition (eg, tetanus or exposure to rabies). The International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM) diagnosis code attached to the vaccine must define the disease or condition.

The prescription drug plan Medicare Part D, however, does cover other preventive vaccines. If the patient has Medicare Part D coverage, it is likely that they have preventive coverage for most vaccines. Travel vaccine coverage will depend on the Part D plan. In states that license pharmacists to provide vaccines, physicians can ask the patient to purchase the covered vaccine at the pharmacy and bring it into the office for administration. Alternatively, the physician can supply the vaccine, administer it in the office and ask the patient for full payment at the time of the service. The patient can then be given a claim form to submit to her Part D plan for reimbursement of her costs.

Medicaid

Medicaid reimburses for routine immunizations for covered individuals up to 21 years of age. For individuals younger than 21 years, there are two different programs that provide these services.

Patients 19–20 years old receive routine immunizations as part of the Early and Periodic Screening, Diagnostic, and Treatment (EPSDT) program. Physicians can bill Medicaid for the vaccines and the administration as a fee-for-service. This public program for low-income and medically indigent individuals is administered on a state-by-state basis. Thus, the extent of immunization coverage for adults varies state by state.

Patients 18 years or younger receive vaccinations through the state’s Vaccines for Children (VFC) Program. This program is described in the next section.

Vaccines for Children Program

When the Centers for Disease Control and Prevention (CDC) investigated the U.S. measles epidemic of 1989–1991, it found that more than one half of the children who had measles had not been immunized, even though many had seen a health care provider. In response, Congress created the VFC Program in 1993.
The VFC Program provides free vaccines to doctors who serve eligible children. It is administered at the national level by the CDC through the National Immunization Program. The CDC contracts with vaccine manufacturers to buy vaccines at reduced rates. Eligible children are those who meet the following criteria:

• Are eligible for Medicaid
• Are 18 years or younger
• Have no health insurance
• Are Native American or Alaska Native
• Have health insurance but no immunization coverage. In these cases, these children must go to a Federally Qualified Health Center or Rural Health Clinic to receive their immunizations.

Vaccinations are provided for these diseases:

• Diphtheria
• Hemophilus influenza type b
• Hepatitis A
• Hepatitis B
• Human papillomavirus
• Influenza
• Measles
• Meningococcal disease
• Mumps
• Pertussis (whooping cough)
• Pneumococcal disease
• Polio
• Rotavirus
• Rubella
• Tetanus
• Varicella

Any physician or physician practice can become a VFC provider. First, contact a State or Territory VFC Program Coordinator. A Provider Enrollment Package will be mailed to the provider. After submission of this packet, the office will have a site visit. During this visit, a representative from the program will review the administrative requirements of the program and the proper storage and handling of vaccines with physicians and staff. Because VFC vaccines are provided free of charge to the practice, an office cannot charge the patient for the vaccine product. However, an administrative fee can be charged to offset the costs of doing business. Each state sets a maximum fee that physicians can charge for administering a VFC vaccine. If the patient has no health insurance, a VFC provider cannot refuse to administer a recommended vaccine because a patient is unable to pay the administration fee. However, the health care provider can accept whatever the patient can afford to pay. The administration fee for Medicaid patients is billed to the Medicaid plan. For more information on the VFC program, visit the CDC web site: http://www.cdc.gov/vaccines/programs/vfc/default.htm.

Commercial Plans

Patients can be enrolled in a variety of private or employer-provided commercial health insurance programs. Coverage for immunizations will vary from plan to plan. Some plans may offer no coverage for preventive medicine services. For patients covered by these plans, it is important to inform them that they will have to bear the costs of immunizations “out-of-pocket.” For patients who have coverage, it is very important to track payments to verify that the reimbursement received covers the cost of the vaccine product and other associated costs. Clinical practices must contact their patients’ insurance plans to verify coverage for preventive and medically indicated vaccines and their administration.

Third-party payers may or may not reimburse for vaccinations provided at the time of a covered evaluation and management (E/M) service. Some third-party payers will disallow the vaccine administration codes at the time of an E/M service unless the E/M service is documented as separate and significant. (See section on “Coding Examples” for additional information on when it is appropriate to bill an E/M service with vaccine administration).

The Initial Reproductive Health Visit

The College recommends that a girl’s first visit to the obstetrician–gynecologist take place between the ages of 13 years and 15 years. This visit is designed to provide health guidance, appropriate screening, and preventive health services. It is an excellent opportunity to discuss on-going immunization status as well as the new recommendations.
for the human papillomavirus vaccine, tetanus and diphtheria toxoids and acellular pertussis vaccine (Tdap), and meningococcal vaccine. The CPT code 99384 is used for a preventive visit for a new patient, aged 12–17 years. The CPT code 99394 is used for a preventive visit for an established patient in the same age range.

It may be appropriate to offer and administer indicated vaccines during these initial reproductive health visits. If these services are performed, the physician should also code for the appropriate vaccine administration code(s) and the appropriate vaccine product code(s) as well as the preventive service.

**Coding for Vaccinations**

*ICD-9-CM Diagnosis Codes for Vaccination Services*

Diagnosis codes for vaccinations usually are from the V code category (Supplementary Classification of Factors Influencing Health Status and Contact with Health Services) of ICD-9-CM. If a patient is being seen for a specific disease or symptom, report both the code for the disease or symptom and a code for the vaccination.

Diagnosis codes used for vaccinations are categorized as follows:

- Persons with potential health hazards related to communicable diseases, including patients who have been exposed to or had contact with someone with a communicable disease
- Persons with need for isolation, other potential health hazards and prophylactic measures, including prophylactic administration of vaccines
- Persons encountering health services in other circumstances, including encounters during which a planned vaccination was not carried out

The diagnosis codes most likely to be reported when vaccinations are administered are listed as follows:

**Persons With Potential Health Hazards Related to Communicable Diseases**

Excludes: family history of infectious and parasitic diseases (V18.8)
personal history of infectious and parasitic diseases (V12.0)

**V01** Contact with or exposure to communicable diseases

- **V01.1** Tuberculosis
  Conditions classifiable to 010–018
- **V01.4** Rubella
  Conditions classifiable to 056
- **V01.5** Rabies
  Conditions classifiable to 071
- **V01.7** Other viral diseases
  Conditions classifiable to 042–078, and V08, except as above
  - **V01.71** Varicella
  - **V01.79** Other viral diseases
- **V01.8** Other communicable diseases
  Conditions classifiable to 001–136, except as above
  - **V01.84** Meningococcus
- **V01.9** Unspecified communicable diseases

**V03** Need for prophylactic vaccination and inoculation against bacterial diseases

Excludes: vaccination not carried out (V64.00–V64.09) vaccines against combinations of diseases (V06.0–V06.9)

- **V03.2** Tuberculosis [BCG]
- **V03.7** Tetanus toxoid alone
- **V03.8** Other specified vaccinations against single bacterial diseases
  - **V03.81** Hemophilus influenza, type B [Hib]
  - **V03.82** Streptococcus pneumoniae [pneumococcus]
  - **V03.89** Other specified vaccination
  - **V03.9** Unspecified single bacterial disease

**V04** Need for prophylactic vaccination and inoculation against certain viral diseases

Excludes: vaccines against combinations of diseases (V06.0–V06.9)

- **V04.0** Poliomyelitis

---

*Note: Obstetrician-gynecologists and their staff should always use the term “coding” in preference to “reimbursement” regarding services rendered. Coding is the action undertaken to secure reimbursement. The intent is to report the services provided using the correct codes; the appropriate reimbursement will follow. If the claim is inappropriately denied, the physician has support for his or her appeal when correct codes were reported.*
V07.2 Prophylactic immunotherapy
Administration of:
immune sera [gamma globulin]
RhoGAM, antivenin, and tetanus antitoxin

Persons Encountering Health Services in Other Circumstances
V64 Persons encountering health services for specific procedures, not carried out
V64.0 Vaccination not carried out
V64.00 Vaccination not carried out, unspecified reason
V64.01 Vaccination not carried out because of acute illness
V64.02 Vaccination not carried out because of chronic illness or condition
V64.03 Vaccination not carried out because of immune compromised state
V64.04 Vaccination not carried out because of allergy to vaccine or component
V64.05 Vaccination not carried out because of caregiver refusal
Guardian refusal
Parent refusal
Excludes: vaccination not carried out for religious reasons (V64.07)
V64.06 Vaccination not carried out because of patient refusal
V64.07 Vaccination not carried out for religious reasons
V64.08 Vaccination not carried out because patient had disease being vaccinated against
V64.09 Vaccination not carried out for other reason

CPT and Medicare Coding for Vaccinations

Vaccination Procedures
A vaccination procedure has two components: 1) the administration of the vaccine and 2) the vaccine (drug) itself. The administration may be performed by either the physician or qualified nonphysician
provider. When both the vaccine drug and the administration are provided by the physician office, report a code for the vaccine and a code for administration of the vaccine.

**Codes for Administration of the Vaccine**

The administration codes specify the method and route of administration (see Table 1 for CPT codes). Medicare and CPT both use the same set of codes to report administration of most vaccines.

Medicare requires special Healthcare Common Procedure Coding System (HCPCS) codes for the administration of influenza, pneumococcal, or hepatitis B vaccines (see Table 2). Note that some commercial carriers also accept these HCPCS codes. A summary of these codes follows.

G codes are temporary codes used to identify professional health care services that would be reported using a CPT code if one existed or to provide more information. Report the G code for administration and the applicable CPT code for the vaccine.

There are no specific HCPCS codes for administration of other vaccines. In these cases, Medicare accepts the appropriate CPT code for the vaccine administration.

**Codes for the Vaccine Drug Product**

Both CPT and Medicare use CPT codes 90476–90749 to report the vaccine drugs (see Table 3, Table 4, Table 5, and Table 6). Beginning in 2006, CPT has included symbol ❌ in front of a code number to indicate that this vaccine was not approved by the U.S. Food and Drug Administration (FDA) at the time the CPT book was published. Once the vaccine has FDA approval, the code is considered active. The changes in vaccine status are posted at www.ama-assn.org/ama/pub/category/10902.html.

- **90473** Immunization administration by intranasal or oral route; one vaccine (single or combination vaccine/toxoid)
- **+90474** Each additional vaccine (single or combination vaccine/toxoid) (List separately in addition to code for primary procedure.)

### Coding Examples

#### CASE 1

A 72-year-old woman comes in for her annual check-up. She also requests a flu vaccine. The patient has Medicare. The appropriate physical examination is performed and a Pap smear specimen is collected.

**Comment:**

Medicare allows coverage for a pelvic examination every 2 years; for certain high-risk patients, it is covered annually. Collection of a Pap specimen is also a reimbursable service at the time of these encounters. Other services (eg, vaccines) also may be performed during these encounters and should be coded and billed separately. Medicare requires specific HCPCS codes for these services. The

**CASE 2**

A 12-year-old new patient is brought to the office by her mother. The patient and her mother want to talk about a variety of topics, including reproductive health, birth control options, and vaccinations.
The patient is not sexually active and declines a pelvic examination and collection of a Pap smear specimen. The appropriate history is obtained. A physical examination limited to the head, chest, abdomen, and extremities is performed. Questions are answered and the appropriate counseling is given. The physician then administers an influenza vaccine, a Tdap vaccine, and the first of the series of three HPV vaccines.

Comment:
This is an example of the initial reproductive health visit recommended by the College. This encounter should be coded using the preventive medicine codes. The comprehensive nature of preventive medicine codes reflects an age and gender appropriate history and/or examination and is not synonymous with the comprehensive examination required in other E/M codes. There are no CPT guidelines stating what is included in a preventive visit; it will vary with the needs of each patient. In this case, a pelvic and breast examination were not necessary. Nevertheless, this encounter is reported as a preventive visit. Other services may be provided at the time of these encounters and should be coded and billed separately. The appropriate procedure codes and ICD-9-CM linkages are listed as follows.

- 99384 Initial comprehensive preventive medicine adolescent (12–17 years)
- V70.0 Routine general medical examination
- 90649 HPV vaccine (quadrivalent) (drug), IM or
- 90650 HPV virus (bivalent) (drug), IM
- V04.89 Need for prophylactic vaccination—other viral illnesses
- 90460 Vaccine administration
- V04.89 Need for prophylactic vaccination—other viral illnesses
- 90658 Influenza virus vaccine (trivalent split virus) (drug), IM
- V04.81 Need for prophylactic vaccination—influenza
- 90461 Vaccine administration—additional vaccine
- V04.81 Need for prophylactic vaccination—influenza
- 90715 Tdap vaccine (drug), IM
- V06.1 Need for prophylactic vaccination—Tdap

</table>

Abbreviation: IM, intramuscular; sub, subcutaneous.

- 90461 Vaccine administration—additional vaccine
- V06.1 Need for prophylactic vaccination—Tdap

NOTE: Some third-party payers deny payment for the vaccine administration codes (90471 and +90472) provided on the same day as a separate and distinct E/M service. It is important to track and appeal such denials because they are in conflict with CPT coding guidelines and standard payment conventions.

Case 3
A 34-year-old established patient requests assistance in obtaining her hepatitis B vaccine. Her insurance plan requires her to obtain her vaccine product from her local pharmacy. She brings the appropriately stored vaccine to the office. The office nurse sees the patient, checks her blood pressure, obtains appropriate informed consent documents, and administers the hepatitis B vaccine.

Comment:
This example describes a situation where the only service provided in the office is the vaccine administration. The services provided by the nurse are integral to the vaccine administration code. A separate E/M service was not provided in this situation. Because the patient brought the vaccine product with her, it is not appropriate to bill for the vaccine
product. The appropriate procedure code and ICD-9-CM linkage is listed as follows.

90471 Vaccine administration  
V05.3 Need for prophylactic vaccination—viral hepatitis

■ CASE 4
A 21-year-old established patient comes in for her wellness examination. She has questions about the HPV vaccine. In addition to the usual age appropriate history, counseling, comprehensive physical examination, and Pap test, the patient is given information regarding the requested vaccine. Her questions are answered and she requests that the first of the series of three vaccinations be given.

Comment:
This example illustrates the additional counseling that will be necessary as new vaccinations become available. The additional work involved with this counseling is integral to the preventive medicine visit and not reported separately. The appropriate procedure codes and ICD-9-CM linkages are listed as follows.

99395 Periodic comprehensive preventive medicine 18–39 years  
V72.31 Gyn exam with Pap  
90649 HPV vaccine (quadrivalent) (drug), IM  
or  
90650 HPV virus (bivalent) (drug), IM  
V04.89 Need for prophylactic vaccination—viral disease  
90471 Vaccine administration  
V04.89 Need for prophylactic vaccination—viral disease

■ CASE 5
The 21-year-old established patient mentioned in Case 4 returns to the clinic in 1 month for the second of her series of three HPV vaccines. She also reports dysuria. The office nurse checks her blood pressure, completes the appropriate vaccine informed consent documents, and orders a urinalysis. The urinalysis result is normal. The nurse administers the HPV vaccine, documents the encounter in the medical record, and asks the patient to make a follow-up appointment with her physician to further assess her report of dysuria.

Comment:
This example illustrates an encounter where the nurse provides a separate E/M service distinct from the vaccine administration service. Some vaccines require a multidose regimen. It is appropriate to use the same vaccine product code for each of the three injections. The appropriate procedure codes and ICD-9-CM linkages are listed as follows. Modifier 25 is appended to the E/M encounter to signify the distinct and separate service.

99211–25 Office outpatient visit (nursing encounter)  
788.1 Dysuria  
81000 Urinalysis  
788.1 Dysuria  
90649 HPV vaccine (quadrivalent) (drug), IM  
or  
90650 HPV virus (bivalent) (drug), IM  
V04.89 Need for prophylactic vaccination—viral disease  
90471 Vaccine administration  
V04.89 Need for prophylactic vaccination—viral disease

■ CASE 6
A 28-year-old new patient presents with severe dysmenorrhea. She also requests an influenza vaccine. A detailed history is taken and a detailed physical examination is performed. The medical decision making is of low complexity. The patient is given information regarding the influenza vaccine and the vaccine is administered by the office nurse.

Comment:
Many times patients will request vaccine services at the time of a problem-oriented visit. It is appropriate to code and bill for the vaccine administration and vaccine product as well as a code for the E/M service. If counseling is extensive and accounts for more than 50% of the total time spent with the patient, it may be appropriate to code based on time rather than the usual key components of history, physical examination, and medical decision making.

99211–25 Office outpatient visit-new patient  
625.3 Dysmenorrhea  
90658 Influenza vaccine (trivalent) (drug), IM
V04.81 Need for prophylactic vaccination— influenza
90471 Vaccine administration
V04.81 Need for prophylactic vaccination— influenza

**Case 7**
A 25-year-old nulligravid patient is receiving prenatal care in the office. At 12 weeks of gestation, she requests an influenza vaccination.

*Comment:*
Pregnant patients will request, and in some instances require, vaccinations during their pregnancies. Vaccination services performed during pregnancy should be billed separately at the time of the service. If a patient has any conditions that might make them high risk for influenza, report a secondary code for the high-risk condition. This will facilitate payment from plans that only cover vaccinations for patients identified as high-risk patients. A separate E/M service should not be reported because the office visit is part of the global obstetric package.

90656 Preservative-free influenza vaccine (trivalent) (drug), IM
V04.81 Need for prophylactic vaccination— influenza
V22.2 Pregnant state, incidental

90471 Vaccine administration
V04.81 Need for prophylactic vaccination— influenza
V22.2 Pregnancy state, incidental

**Case 8**
The patient referenced in Case 7 is now at 28 weeks of gestation. She is Rh negative and is administered antenatal Rh immune globulin.

*Comment:*
It is appropriate to code and bill for the Rh immune globulin administration outside the global obstetric package. Some payers may require the use of special HCPCS codes (“J” codes) to identify the Rh immune globulin product. Also, note that the CPT codes for administration of immune globulins are different than those used for administration of vaccines.

90384 Rho(D) immune globulin (RhIg), full dose (drug), IM
or J2790

V07.2 Prophylactic administration of RhoGAM
96372 Injection (therapeutic, prophylactic, or diagnostic), subcutaneous or intramuscular
V07.2 Prophylactic administration of RhoGAM

**Case 9**
The patient referenced in Case 7 and Case 8 is now 6 weeks postpartum. On her antenatal screening, her Rubella titer was negative. She is given a measles, mumps, and rubella vaccination. It also is noted that the patient has not received a pertussis immunization. The Advisory Committee on Immunization Practices recommends that individuals in close contact with infants should receive a pertussis immunization to prevent the spread of pertussis to the infant. The patient is given a Tdap vaccine.

*Comment:*
The postpartum visit will, often times, require vaccination services. Again, these services should be coded and billed outside the global obstetric package. A separate E/M service should not be reported because the 6-week postpartum visit is part of the global obstetric package.

90707 MMR vaccine, live (drug), subcutaneous
V06.4 Need for prophylactic vaccination— MMR
90471 Vaccine administration
V06.4 Need for prophylactic vaccination— MMR
90715 Tdap vaccine (drug), IM
V06.1 Need for prophylactic vaccination— Tdap
+90472 Vaccine administration—additional vaccine
V06.1 Need for prophylactic vaccination— Tdap

**Coding Resources**
The College has developed the following resources to assist physicians with selecting the correct codes and interacting with third-party payers. In addition to these publications, coding workshops, and coding webcasts, a web site for questions and
information is provided at www.acog.org. Publications listed can be ordered through the Publications and Educational Materials catalog, online at http://sales.acog.org/bookstore/, or from the distribution center (1-800-762-2264).

- **ICD-9-CM Abridged, Diagnostic Coding in Obstetrics and Gynecology** (http://sales.acog.org/bookstore/ICD-9-CM_Abridged_Diagnostic__P313C56.cfm)—this book provides all the ICD-9-CM diagnosis codes most commonly reported by obstetrician–gynecologists in the same format as the complete ICD-9-CM book. This version also includes guides to assist with diagnostic reporting of pregnancy termination, follow-up visits for Pap tests, and obstetric ultrasound examinations. Due to the current ICD code freeze, the codes in the 2012 version of the ICD-9-CM Abridged publication represent the final version of the ICD-9-CM code set prior to ICD-10 implementation scheduled for October 1, 2014. There will be no additional ICD-9-CM code set updates.

- **Ob/Gyn Coding Manual: Components of Correct Procedural Coding with CD-ROM** (http://sales.acog.org/bookstore/_P317.cfm)—this 400+ page book provides important information to assist physicians in correct coding for surgical procedures commonly performed by obstetrician–gynecologists. Each code is listed with services that are part of the procedure’s global surgical package, information about whether Medicare will reimburse for an assistant or co-surgeons for the procedure, and other coding hints. In addition, it includes information about the included and/or excluded services according to both Medicare’s Correct Coding Initiative and ACOG’s Committee on Coding and Nomenclature developed the answers. Subjects include gynecologic surgery, emergency medicine services, laboratory services, modifiers, infertility, laparoscopy and hysteroscopy, Medicare, obstetrics, and ultrasound examinations. Revised every odd-numbered year.

- **The Essential Guide to Coding in Obstetrics and Gynecology**—this publication includes information from ACOG’s coding workshop syllabus and other ACOG coding resources not in work-book format. The book covers coding diagnoses and procedures, E/M services, gynecologic surgery, obstetric services, ultrasound procedures, infusions, injections, immunizations, vaccinations, services to Medicare patients, and preventive care. Other chapters discuss use of modifiers and dealing with third-party payers. Revised every even-numbered year.

- **Procedural Coding in Obstetrics and Gynecology**—this booklet provides an introduction to the basics of CPT, Fourth Edition, procedure coding and to the new codes for the current year. In addition, chapters are devoted to ultrasound examinations and clarifying the sometimes confusing issue of modifiers. The booklet is revised every even-numbered year. In odd-numbered years, members receive the Supplement to Procedural Coding in Obstetrics and Gynecology, which describes the CPT coding changes for the year.

Other coding resources include:

- **Healthcare Common Procedure Coding System** (HCPCS)—a coding system established in 1978 as a way to standardize identification of medical services, supplies, and equipment. There are two sets of codes. The first level, or Level I, of the HCPCS comprises Current Procedural Terminology (CPT), a numeric coding system maintained by the American Medical Association (AMA). The second level, or Level II, is a code set for medical services not included in Level I, such as durable medical equipment, prosthetics, orthotics, and supplies.

- **American Medical Association’s Current Procedural Terminology (CPT)**—the most widely accepted medical nomenclature used to report medical procedures and services under public and private health insurance programs. It was developed by the American Medical Association in 1966. Each year, an annual publication is
prepared that makes changes corresponding with significant updates in medical technology and practice.

• International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM)—is based on the World Health Organization’s Ninth Revision, International Classification of Diseases (ICD-9). The ICD-9-CM is the official system of assigning codes to diagnoses and procedures associated with hospital utilization in the United States. The ICD-9 is used to code and classify mortality data from death certificates. Due to the current ICD code freeze, the codes in the 2012 version of the ICD-9-CM Abridged publication represent the final version of the ICD-9-CM code set prior to ICD-10 implementation scheduled for October 1, 2014. There will be no additional ICD-9-CM code set updates.
